长期以来，“protein（蛋白质）”的摄入量一直被视为饮食健康的关键指标之一。然而，随着科学研究的深入和公众健康意识的提升，“fibre（纤维素）”作为调节肠道和消化系统的重要营养物质，受到了更广泛的重视。本文简述纤维素的健康功效。

词汇: health 健康

1 Since its discovery, food businesses have encouraged high-protein diets, according to research by the University of Oregon. Whether it's bars, shakes or even marshmallows, protein has always prevailed in conversations about health and fitness. Some people think that these kinds of diets are a fad because high-protein products appear on supermarket shelves often. However, these diets have slightly stagnated within the realm of wellness.

2 And that's because there's now another food group gaining popularity – fibre. Found in foods like fruits, vegetables, grains, nuts, seeds, and legumes, our enzymes can't break down fibre into nutrients to absorb like it would with other food groups. Instead, it passes through the digestive system, which helps regulate bowel movements. Multiple studies have shown that certain types of fibre can lower cholesterol, help manage blood sugar levels and improve general gut health. It can also help you feel fuller for longer as it takes more time to digest.

3 The World Health Organisation recommends that adults consume 25-35g of fibre a day. However, research by Tate & Lyle between the years of 2021 and 2022 shows that adults in many countries aren't even close to that benchmark. The National Institute of Health tells us that the fibre intake in women is less than men. Additionally, data from the World Health Organisation shows a trend that those living outside of cities, like villages and in the countryside, have lower fibre consumption in comparison to those who live in cities.

4 Studies have found that not eating enough fibre can have detrimental consequences on your health. Without it, your gut bacteria can't fight excess inflammation, provide energy, or manage your blood sugar levels or your mood. Physically, you're more likely to be constipated and to feel sluggish and tired.

5 So, what can you do? Well, dieticians say that you should eat five to eight portions of fruit and vegetables a day. Try throwing in a handful of cooked lentils or chickpeas into curries, soups or salads. You can also eat seeds, nuts and dried fruit as your snack between meals. It

might feel fashionable to talk about fibre at the moment, but science suggests that we need it to be healthy. So, be careful to follow dieticians' advice and try to eat your fruits and veggies!

测验与练习

一、将标题和段落配对。

Paragraph 1 _____ Paragraph 2 _____ Paragraph 3 _____ Paragraph 4 _____ Paragraph 5 _____

a. Are we eating enough fibre? b. How to increase your fibre intake. c. Is fibre seen as a fad diet? d. What can happen if you don't eat enough fibre? e. What is fibre, and why is it important? f. What was popular before fibre?
