

词汇: **health** 健康

- 1 Take your height in metres, square it, then divide it by your weight in kilograms. That's how you calculate your **body mass index**, or BMI. If it's between 18 and 25, your weight is healthy. If it's over, it isn't. So far, so simple. BMI has become a popular **metric** for people to check their health.
- 2 On a **population level**, data backs this up. People with a high BMI are **statistically** more likely to develop conditions such as **hypertension**, **diabetes**, **arthritis**, and some types of cancer along with other health problems. Checking BMI could be a way for people to easily assess their health and decide if they need to make any **lifestyle changes**.
- 3 However, BMI does not **give the full picture**. It's known that it's less accurate for some groups of people, such as children, the elderly or athletes. The measure was devised in the 19th Century by a Belgian mathematician, and this may be why the figures are more accurate for Europeans than other **ethnicities**. There are also several important factors that it doesn't measure. Someone who is very active may have significant weight from muscle. BMI doesn't differentiate between this or the **visceral fat** that is linked with **negative health outcomes**. It doesn't account for the range of **nutrients** or the level of **cholesterol** in someone's diet. What this means is that people can have a high BMI and be relatively healthy, while others may have a low BMI but be unhealthy.
- 4 The simplicity of BMI is attractive, it's also very visible and fits with society's perception of the importance of weight. However, **dependence** on it as an **indication** of health can cause **stigma**. People can feel judged because of their weight. This sometimes leads people to avoid going to the doctors if they know they're likely to be questioned on it. While BMI may be a useful measure, experts remind us that it should always be considered alongside other measures, such as blood pressure, blood sugar level, cholesterol level and others.

测验与练习

一、将标题和段落配对。

Paragraph 1 _____

Paragraph 2 _____

Paragraph 3 _____

Paragraph 4 _____

- a. Not a complete vision
- b. Dangerous in isolation?
- c. A metric for exercise
- d. Simple to measure
- e. Reflected in data

二、根据文章内容选出正确的选项。

1. A BMI over 25 is considered unhealthy.

- a. True
- b. False
- c. Not given

2. What does 'this' refer to in the following sentence? *On a population level, data backs **this** up.*

- a. BMI being between 18 and 25
- b. Risk of developing serious conditions
- c. Using BMI to check health

3. Data shows that a high BMI means people have a higher chance of developing serious health problems.

- a. True
- b. False
- c. Not given

4. What is connected with health problems?

- a. muscle weight
- b. nutrients
- c. visceral fat

5. Why do people sometimes avoid going to the doctors?

- a. They are dependent on BMI.
- b. They are insecure about their weight.
- c. They have high blood pressure.

三、用方框中的单词完成对本文的总结。

BMI is a popular **1)** _____ for assessing health. It can show if people are **2)** _____ more at risk of some conditions. However, it doesn't always **3)** _____. It doesn't say whether someone's weight is caused by muscle or **4)** _____. Unless we see it as one of several measures, we might create an unhealthy **5)** _____ around weight.

visceral fat	stigma	metric
give the full picture		statistically
dependence		negative health outcome

（答案见词汇表后）

词汇表

body mass index	身体质量指数
metric	指标, 衡量标准
population level	人口水平
statistically	从统计学上看
hypertension	高血压
diabetes	糖尿病
arthritis	关节炎
lifestyle change	生活方式的改变
give the full picture	展现一件事情的全貌
ethnicity	种族
visceral fat	内脏脂肪
negative health outcome	负面的健康后果
nutrient	营养, 营养元素
cholesterol	胆固醇
dependence	依赖
indication	指标, 标志物
stigma	不良行为

答案

一、将标题和段落配对。

Paragraph 1 **d) Simple to measure**

Paragraph 2 **e) Reflected in data**

Paragraph 3 **a) Not a complete vision**

Paragraph 4 **b) Dangerous in isolation**

二、根据文章内容选出正确的选项。

1. **a. True.** *That's how you calculate your body mass index, or BMI. If it's between 18 and 25 your weight is healthy, **if it's over, it isn't.***

2. **c.** *The pronoun 'this' refers to the sentence 'BMI has become a popular metric for people to check their health'.*

3. **a. True.** *People with a high BMI are **statistically** more likely to develop conditions such as **hypertension, diabetes, arthritis**, and some types of cancer along with other health problems.*

4. **c.** *BMI doesn't differentiate between this or the **visceral fat that is linked with negative health outcomes.***

5. **b.** *However, dependence on it as an indication of health can cause create stigma. People can feel judged because of **their weight**. This sometimes leads people to avoid going to the doctors **if they know they're likely to be questioned on it.***
